The aim:

Transfer Waypoints including their icons and Info/Comments (visible in MapSource/Basecamp) to the Zumo XT. This seemingly simple task appears impossible, every method has problems!
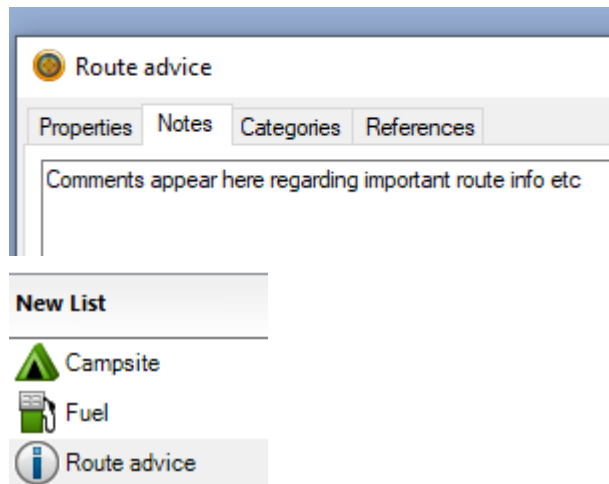

1. **USB Import of GPX (using Windows Explorer or Basecamp)**
    a. Icons aren't retained, they <u>all</u> appear as oversized green hearts on device.
   i. MapSource:

| Name /	S...	Comment	Position
Campsite	🏕️		N51.25000 W3.50000
Fuel	⛽		N51.25000 W3.55000
Route advice	ⓘ	Comments appear here regarding important route info etc	N51.25000 W3.60000

        ii. Basecamp:

        iii. Device:

    b. Info/comment is not accessible on device! A serious problem.
   c. Icons only visible when 'Up Ahead Places' is selected (this is less important).

2. **Explore Website**
    a. Sometimes import of a GPX containing waypoints will fail if there is a Comment/Info. But this is irrelevant as the info isn't visible in Explore anyway.
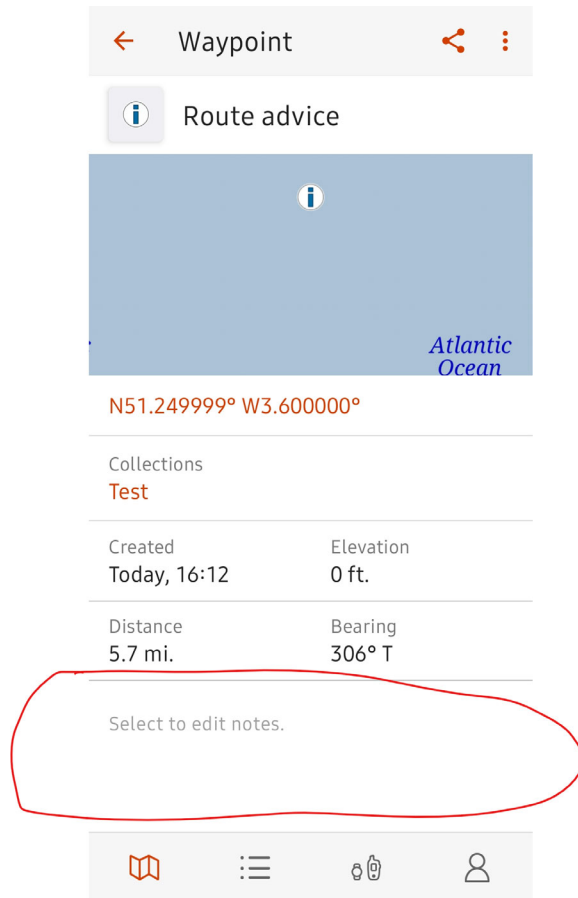

b. Icons are still not retained from the GPX:

c. But the icons are decent and a sensible size, and can be allocated within Explore, and transfer to the Device successfully:
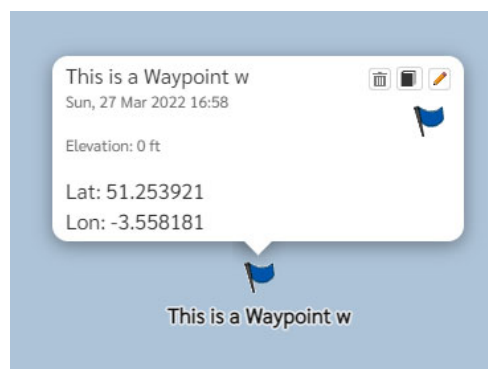

d. Info/comment is not accessible on device, Explore website or Android App (even though you can apparently 'Edit Notes' in the app:

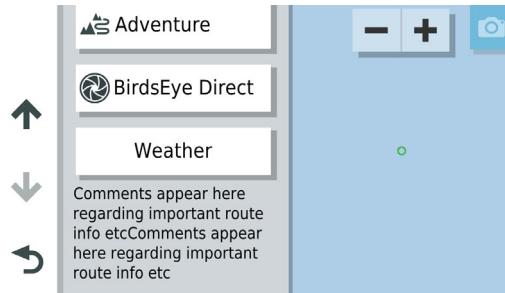

e. Only the first 20 characters of a Waypoint name are imported:

3. POI Loader

a. The Comment/info is accessible! Although for some reason it's duplicated:

      b. Long Waypoint names (20+ characters) are retained.

      c. But, the icons aren't permanently visible on the device's map, they're only visible when searching within Custom POI's.

4. *Conclusion*

The only workaround is to duplicate the information: **Explore** to give visible icons without having to manually create every icon on the device, and **POI**'s for the Info/Comment. Which is absurd!
