

Loading routes, or tracks, in Google maps.

- 1) Export your route as a **.kml** file. Screenshot shown is Basecamp, but other programs like MyRouteApp and TripManager can also do that.

Tip: Export just what you need, Google Maps has a limit.

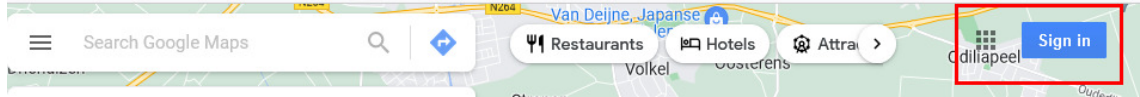

Change 'Save as type' to **KML 2.2 Document, v2 (*.kml)**

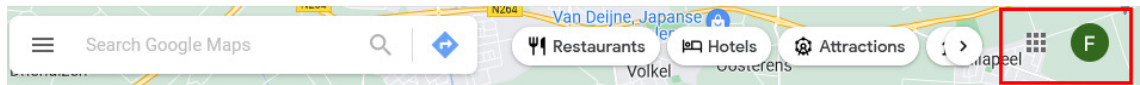

Note: This filetype can also be used to load in 'Google Earth', 'Maps.Me', 'Organic Maps' and probably many more programs.

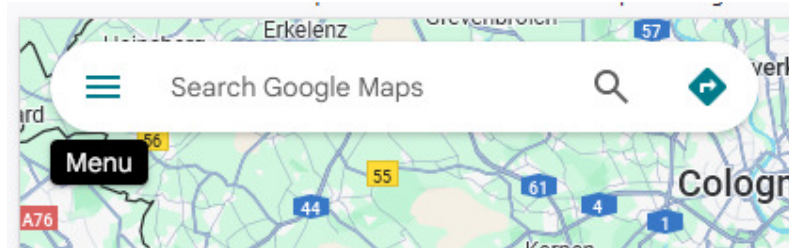

- 2) Next steps have to be done in a browser on a PC/Laptop. It is not possible with the App on Android or Iphone. (At least not that I know)
- 3) Open Google Maps in a browser. <https://www.google.com/maps>
Make sure you are signed in with your Google Account. If you also want to see the map (route) on your mobile phone, use the same account as the one on your mobile phone.

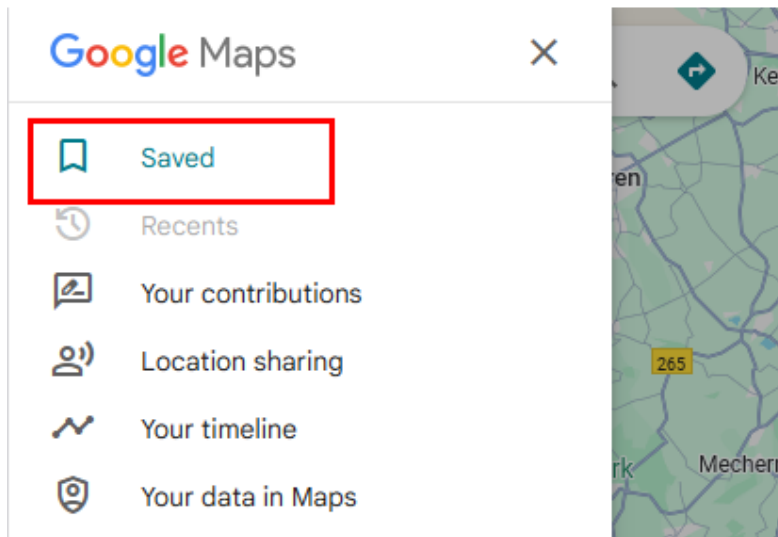

Sign in should change to a Letter.

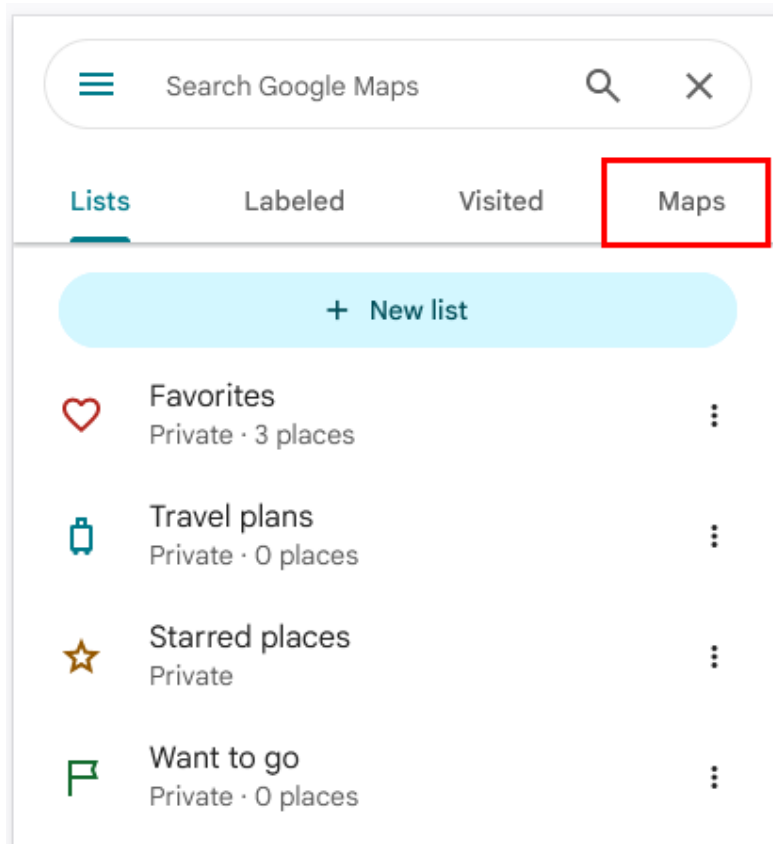

- 4) Go to the menu/Saved

Saved

5) Choose Maps

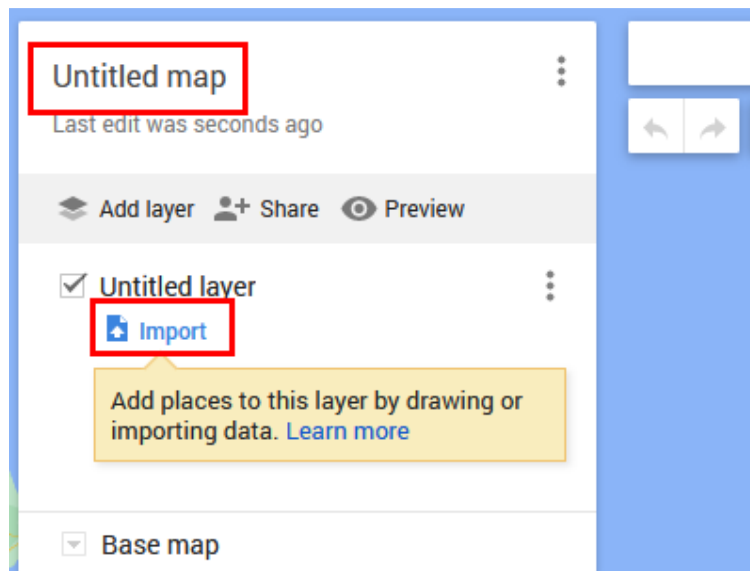

6) Create Map (located at the bottom)

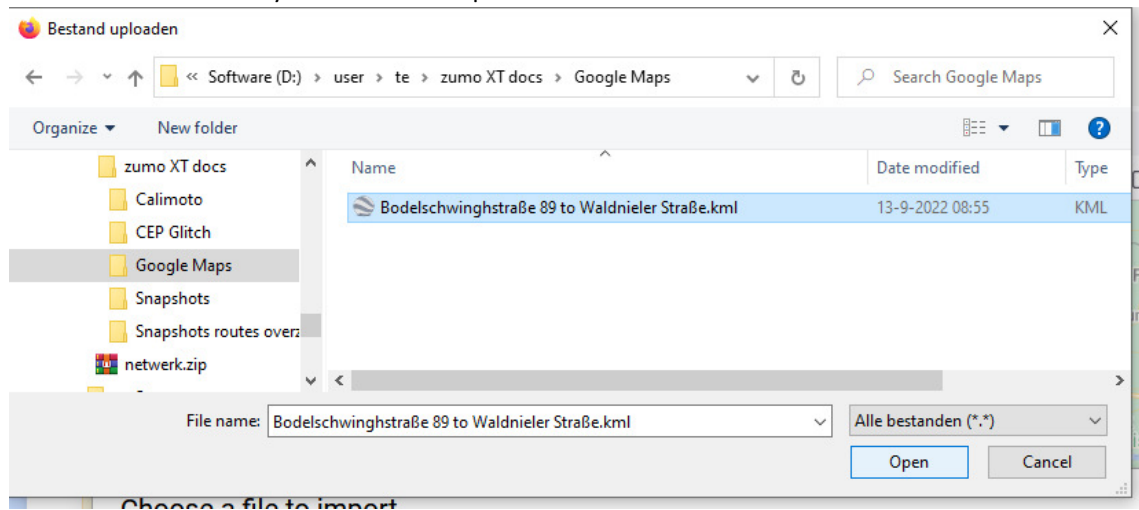

[SEE ALL YOUR MAPS](#)

[CREATE MAP](#)

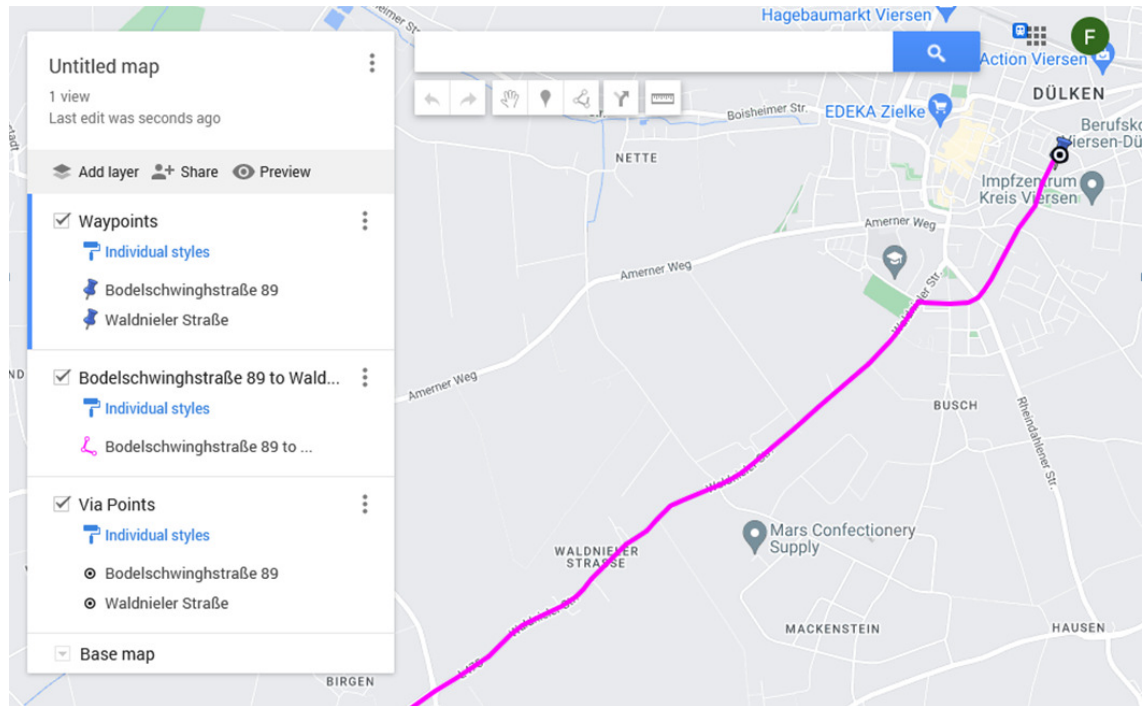

7) Name the map, by clicking on 'Untitled map'. Then choose import.

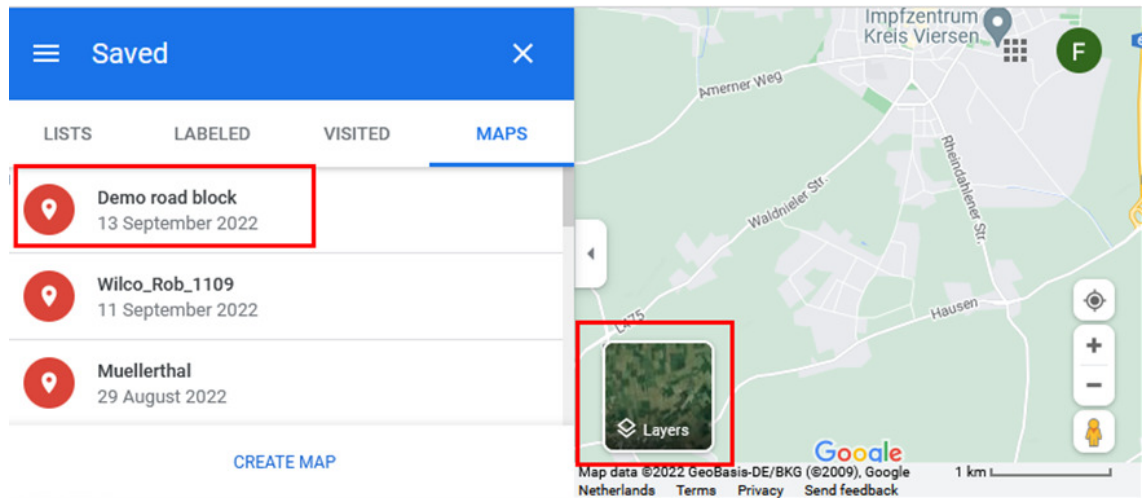

8) Select the .kml file that you created in step 1

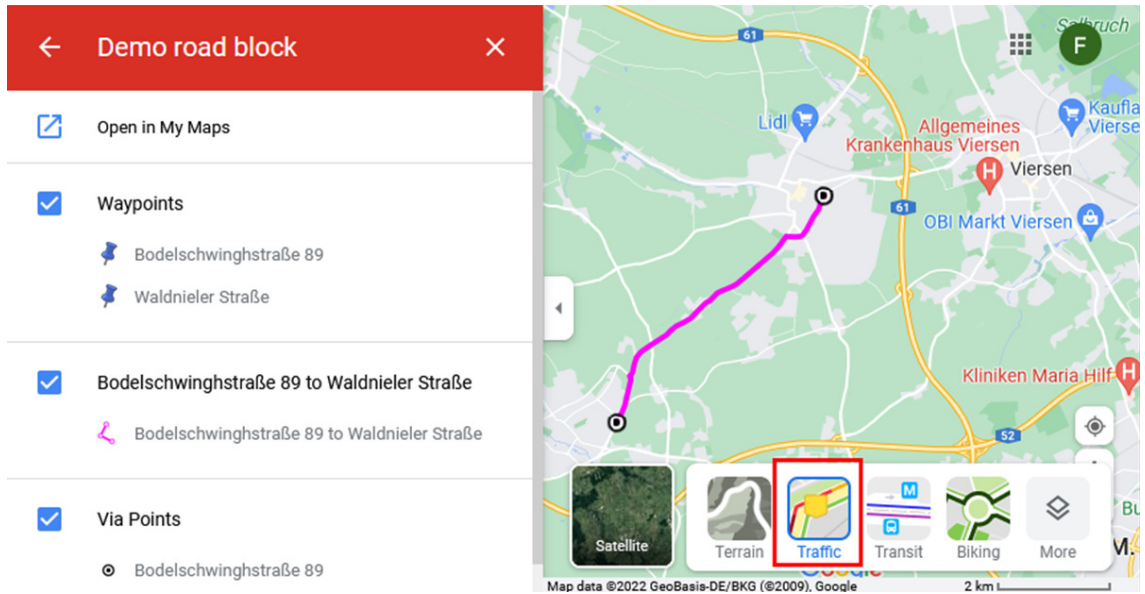

- 9) After some processing the route appears.
Because data is saved in the cloud, more precise on your 'Google Drive', it can take a while for large documents to complete.

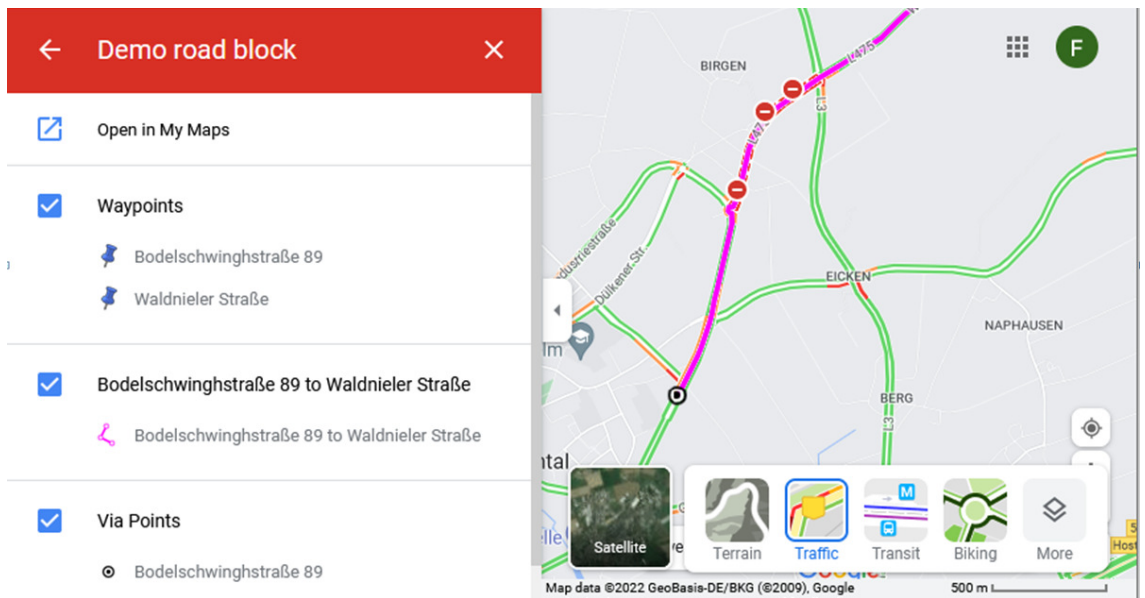

- 10) Close the tab, or refresh the Google maps page.
The Map 'Demo road block' has been added. Click on it to make it visible.

11) Hover with the mouse above 'Layers', then enable Traffic

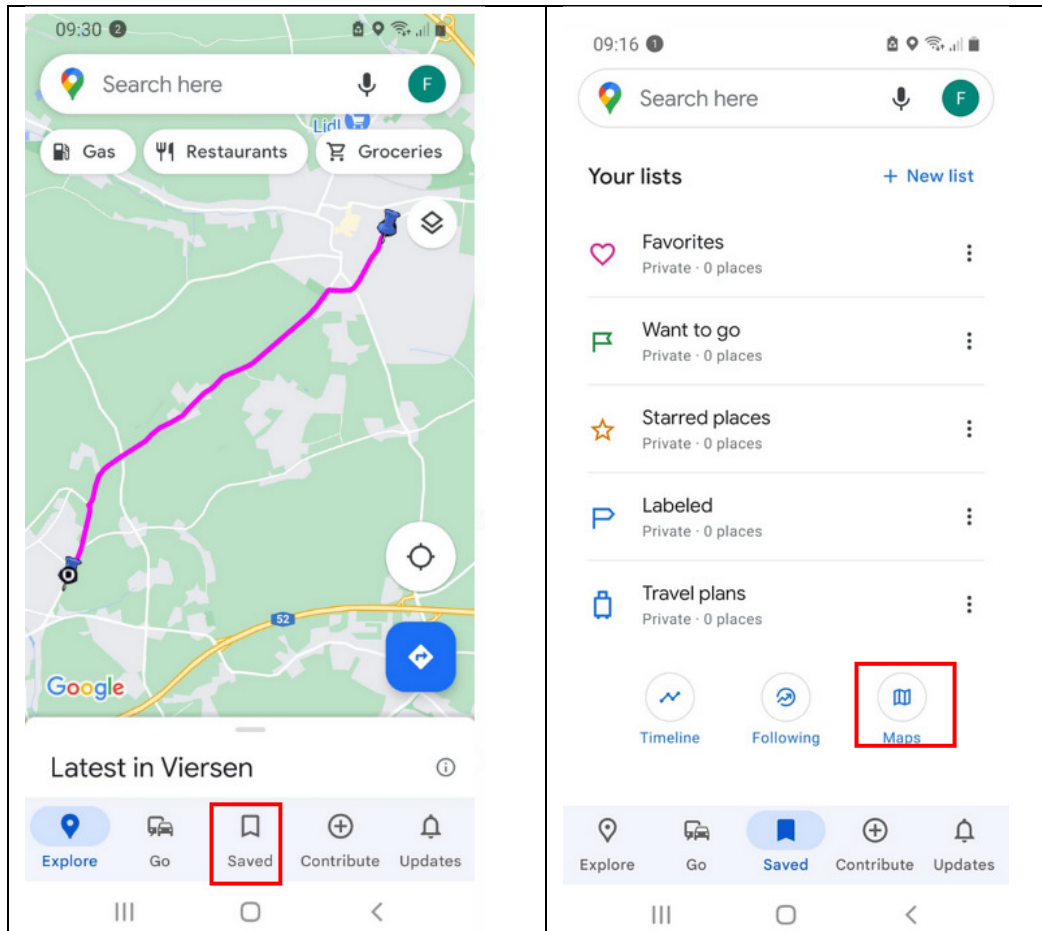

It will show you the road block....

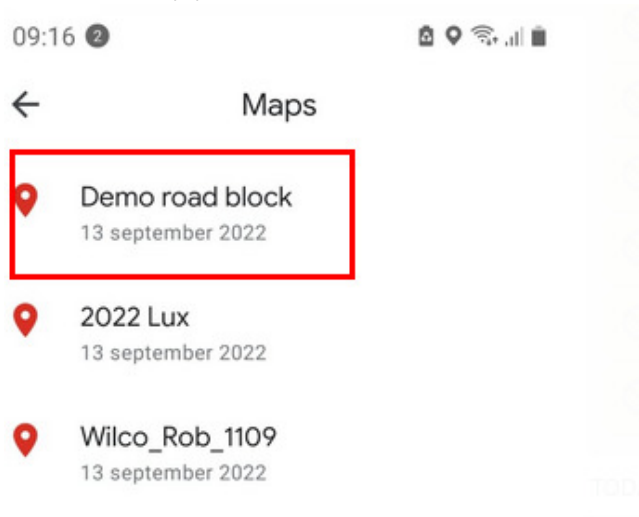

How to see the map on the Mobile phone App. (Screenshots are from Samsung Android)

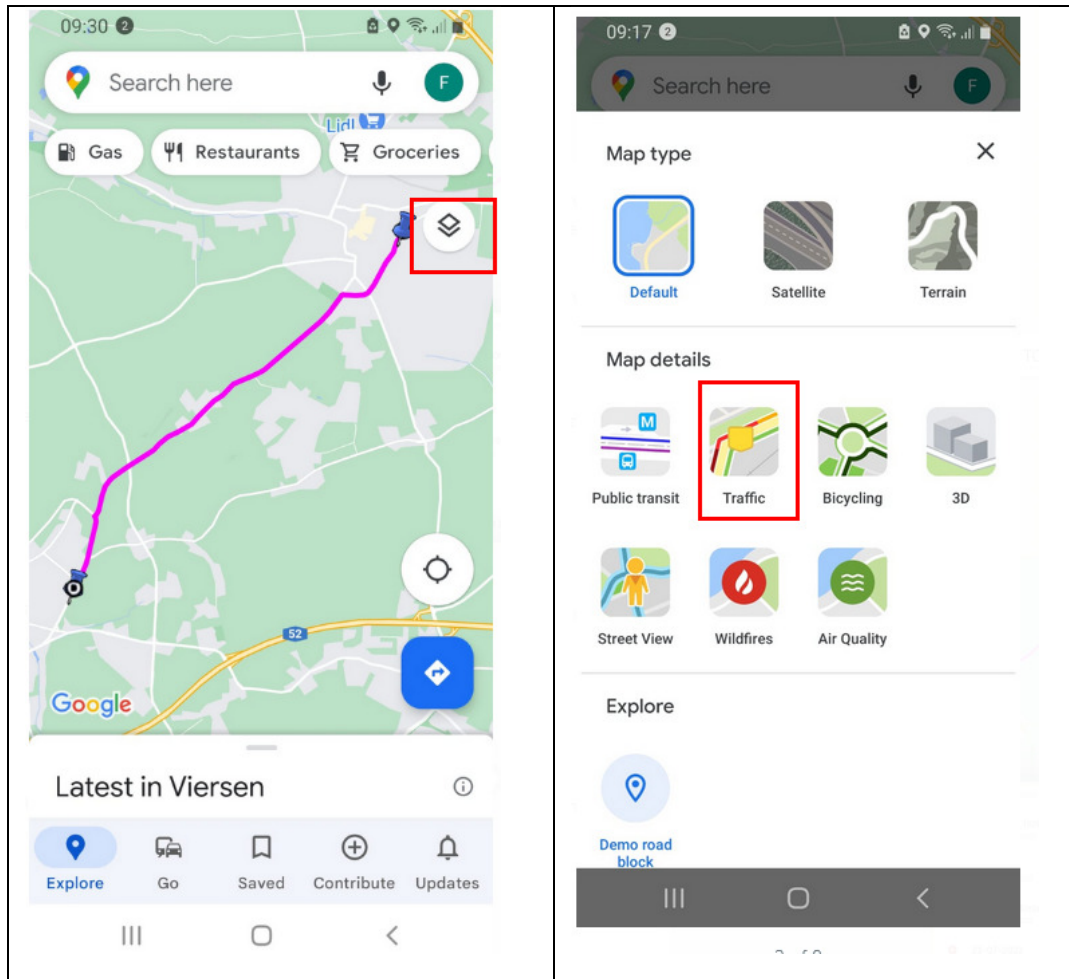

- 1) Use the same account as the one used to create the Map. (Notice the letter F)
- 2) Open Google Maps, click on Saved, then Maps.

- 3) Click on the map you want to enable.

- 4) Press Back until you are on the main screen. (3 times ?)
- 5) Enable the traffic layer.

The road block found...
